GitHub GraphQL Server for Delphi - DevExpress vcl GraphQL 15 full source. Link Developers Team is the best choice for developers offering Delphi,.Net, Database, Xamarin, Android all kind of tools available for download.Q: How to change a volume setting of a device without suspending it? I am trying to change the volume of a device via a USB key without it suspending while the system is doing other things. I have tried this, but if the volume is already above the threshold, the system will freeze up for about a second. But if the volume is low, it can't be changed and it doesn't freeze up. How can I accomplish this? A: There is probably a solution, but I don't know of any. If you do a google search for Droid to android os, you'll find numerous experiments in the forums that suggest udev or something similar, but I've not found anything that will work for everyone. Personally, I never use a USB device without suspending in the background to avoid freezes, but I'm so used to this stuff by now, I don't really care. Q: What's the difference between a VHD and an image? An "image" seems to be just an object stored on a VHD. The D:\ drive, for example, seems to be just a VHD "structure" that stores a bunch of objects on it. And, an "image" seems to be just the state of some objects on a VHD... for example, in Windows Server 2008 and Windows Server 2012, I'm seeing the "volume service state" being stored as an "image". What's the difference between these "images" and "VHD's"? A: Gosh, I've been using the phrase "image" for so many years it's not even funny anymore. I just use "disk" unless there's a particular version of Windows I'm discussing. In my Windows Server 2012 experience I haven't seen the "volume service state" as anything more than a disk--that's just the name of the volume the VSS is stored on. At the end of the day,
